SSYNC Semi-Synchronous - For each round, a set of robots are activated/executed at the same time.

The scheduler can be of two types :

SSYNC Semi-Synchronous - For each round, a set of robots are activated/executed at the same time.

ASYNCR Asynchronous - The robots are activated/executed asynchronously

- There is a 1-robot block of size l

Gathering Problem : The goal of the gathering problem is to group all the robots on the same node.

Orientation Problem : The goal of the set formation problem is to make the robots gather in a configuration such that :

- There is exactly one tower node
- There is a 1-robot block of size l

Set formation problem : The goal of the set formation problem is to gather the robots in a specific predefined configuration.

Proof of the non existence of gathering algorithm in two weak conditions :

- ASYNCR Model
- SSYNCR Model - global-weak & local-strong multiplicity

Proof of the non existence of gathering algorithm in two weak conditions :

- ASync Model
- SSync Model - global-weak & local-strong multiplicity

How to prove non existence of an algorithm ?

Proof of the non existence of gathering algorithm in two weak conditions :

- ASync Model
- SSync Model - global-weak & local-strong multiplicity

How to prove non existence of an algorithm ? **play the scheduler**

(absurd) We assume that there is a algorithm A which works with probability at least $p(k, n)$.

We assume that we have a procedure $Proc(X)$ such as :

- 1 $Proc(X)$ activate each robot at least one

We assume that we have a procedure $Proc(X)$ such as :

- 1 $Proc(X)$ activate each robot at least one
- 2 $Proc(X)$ is complete in finite time

(absurd) We assume that there is a algorithm A which works with probability at least $p(k, n)$.

We assume that we have a procedure $Proc(X)$ such as :

- ① $Proc(X)$ activate each robot at least one
- ② $Proc(X)$ is complete in finite time
- ③ if $P(X) :=$ probability that there is no robot change during $Proc(X)$ execution, then $\lim_{X \rightarrow \infty} P(X) = 1$

(absurd) We assume that there is a algorithm A which works with probability at least $p(k, n)$.

We assume that we have a procedure $Proc(X)$ such as :

- 1 $Proc(X)$ activate each robot at least one
- 2 $Proc(X)$ is complete in finite time
- 3 if $P(X) :=$ probability that there is no robot change during $Proc(X)$ execution, then $\lim_{X \rightarrow \infty} P(X) = 1$

Probability that A achieve gathering in j cycle :

$$P^* < (1 - P(X_1)) + (1 - P(X_2)) + \dots + (1 - P(X_j)) < p \quad \square$$

Construct $Proc(X)$:

- one robot per node

Construct $Proc(X)$:

- one robot per node
- $Q = +i$ ($0 \leq i \leq n$) indicates (v_0, \dots, v_{i-1}) decides to move forward.

- one robot per node
- $Q = +i$ ($0 \leq i \leq n$) indicates (v_0, \dots, v_{i-1}) decides to move forward.

We want to achieve $Q = +n$ or $Q = -n$.

In $proc(X)$, scheduler repeat following steps :

- if $Q = 0$: look and compute phases on robot r on v_0 :
 - if r want to stay $\Rightarrow Q := 0$
 - elif r want to move forward $\Rightarrow Q := 1$
 - elif r want to move backward $\Rightarrow Q := -1$

- if $Q = 0$: look and compute phases on robot r on v_0 :

- if r want to stay $\Rightarrow Q := 0$
- elif r want to move forward $\Rightarrow Q := 1$
- elif r want to move backward $\Rightarrow Q := -1$

- if $Q = +i$: look and compute phases on robot r on v_{+i} :
 - if r want to stay $\Rightarrow Q := +i$
 - if r want to move forward $\Rightarrow Q := +(i + 1)$
 - if r want to move backward : move phase for r and robot of $v_{+(i-1)}$ $\Rightarrow Q := +(i - 1)$.

- if $Q = 0$: look and compute phases on robot r on v_0 :
 - if r want to stay $\Rightarrow Q := 0$
 - elif r want to move forward $\Rightarrow Q := 1$
 - elif r want to move backward $\Rightarrow Q := -1$
- if $Q = +i$: look and compute phases on robot r on v_{+i} :
 - if r want to stay $\Rightarrow Q := +i$
 - if r want to move forward $\Rightarrow Q := +(i + 1)$
 - if r want to move backward : move phase for r and robot of $v_{+(i-1)} \Rightarrow Q := +(i - 1)$.
- if $Q = -i$: ...

In $proc(X)$, scheduler repeat following steps :

- if $Q = 0$: look and compute phases on robot r on v_0 :
 - if r want to stay $\Rightarrow Q := 0$
 - elif r want to move forward $\Rightarrow Q := 1$
 - elif r want to move backward $\Rightarrow Q := -1$

 - if r want to stay $\Rightarrow Q := +i$
 - if r want to move forward $\Rightarrow Q := +(i + 1)$
 - if r want to move backward : move phase for r and robot of $v_{+(i-1)} \Rightarrow Q := +(i - 1)$.
- if $Q = -i$: ...

Stop when $Q = +n$ or $Q = -n$ (or X steps).

- prop 1 and 2 or clearly statisfied.

- prop 1 and 2 are clearly satisfied.
- for prop 3 :
 - $P(Q_{h+1} - > Q_h + 1) = p_1$
 - $P(Q_{h+1} - > Q_h - 1) = p_2$
 - $P(Q_{h+1} - > Q_h) = 1 - p_1 - p_2$

- This implies from any configuration Q , $Q = +/ - n$ is achieved is less than $2n$ step with probability $p > p_1^{2n} + p_2^{2n}$.

- prop 1 and 2 are clearly satisfied.
- for prop 3 :
 - $P(Q_{h+1} - > Q_h + 1) = p_1$
 - $P(Q_{h+1} - > Q_h - 1) = p_2$
 - $P(Q_{h+1} - > Q_h) = 1 - p_1 - p_2$

This implies from any configuration Q , $Q = +/ - n$ is achieved is less than $2n$ step with probability $p > p_1^{2n} + p_2^{2n}$.

$$P(X) \geq 1 - (1 - p_1^{2n} - p_2^{2n})^{\frac{X}{2n}}$$

- prop 1 and 2 are clearly satisfied.

- for prop 3 :

- $P(Q_{h+1} - > Q_h + 1) = p_1$
- $P(Q_{h+1} - > Q_h - 1) = p_2$
- $P(Q_{h+1} - > Q_h) = 1 - p_1 - p_2$

This implies from any configuration Q , $Q = +/ - n$ is achieved is less than $2n$ step with probability $p > p_1^{2n} + p_2^{2n}$.

$$P(X) \geq 1 - (1 - p_1^{2n} - p_2^{2n})^{\frac{X}{2n}}$$

$$\lim_{X \rightarrow \infty} P(X) = 1$$

Gathering problem :

- We consider n nodes and k robots in an unoriented ring

Gathering problem :

- We consider n nodes and k robots in an unoriented ring
- For any configuration C we not $M(C)$ the maximum number of robots on one node

- If there is only once $M(C)$ -node, then the robots "know" where to go
- If there is multiple, the idea is to try to make them move one by one so that a tower node "wins the fight". We must find a way to elect a candidate.
- If there are multiple candidates, find a way to make, in expectation, exactly one of them move

Idea :

- If there is only once $M(C)$ -node, then the robots "know" where to go
- If there is multiple, the idea is to try to make them move one by one so that a tower node "wins the fight". We must find a way to elect a candidate.
- If there are multiple candidates, find a way to make, in expectation, exactly one of them move
- **Take care!** The scheduler is an enemy and will activate the robots in the worst way.

◀ ◻ ▶ ◀ ◻ ▶ ◀ ≡ ▶ ◀ ≡ ▶ ≡ ↺ 🔍 ↻ 23/30

Let's consider the $M(C)$ nodes :

Case 1 There is only one such node : the tower can be identified by the robots and they can get closer to the tower node.

Case 1 There is only one such node : the tower can be identified by the robots and they can get closer to the tower node.

- ◀ ◻ ▶ ◀ ◻ ▶ ◀ ≡ ▶ ◀ ≡ ▶ ≡ ↺ 🔍 ↻ 23/30

Case 2 There are multiple such nodes :

Case 2 There are multiple such nodes :

Take h_{min} the minimal distance between a M(C)-robot node and a neighboring robot node. Take V the set of nodes at distance h_{min} of a M(C)-node and R the robots on these nodes.

Case 2 There are multiple such nodes :

Take h_{min} the minimal distance between a M(C)-robot node and a neighboring robot node. Take V the set of nodes at distance h_{min} of a M(C)-node and R the robots on these nodes.

Cas 2.1 $|R| = 1$ - This robot gets to his closer M(C)-robot node.

Case 2 There are multiple such nodes :

Take h_{min} the minimal distance between a M(C)-robot node and a neighboring robot node. Take V the set of nodes at distance h_{min} of a M(C)-node and R the robots on these nodes.

Cas 2.1 $|R| = 1$ - This robot gets to his closer M(C)-robot node.

Cas 2.2 $|R| > 1$ - The robots move to their close M(C)-robot node with probability $\frac{1}{2|R|}$.

Case 2 There are multiple such nodes :

Take h_{min} the minimal distance between a M(C)-robot node and a neighboring robot node. Take V the set of nodes at distance h_{min} of a M(C)-node and R the robots on these nodes.

Cas 2.1 $|R| = 1$ - This robot gets to his closer M(C)-robot node.

Cas 2.2 $|R| > 1$ - The robots move to their close M(C)-robot node with probability $\frac{1}{2|R|}$.

Complexity : $O(n \log k)$ rounds and $O(kn)$ moves.

- based on gathering algorithm

Algorithm for self oriented problem :

- based on gathering algorithm
- two phases algorithm

Algorithm for self oriented problem :

- based on gathering algorithm
- two phases algorithm
- ! gathering or orientation ?

Algorithm for self oriented problem :

- based on gathering algorithm
- two phases algorithm
- ! gathering or orientation ?
- complexity : $\mathcal{O}((\log k + l)n)$ expected rounds and $\mathcal{O}(l(k + n))$ expected moves

Phase 1 :

Phase 1 :

Reaches a configuration C_{f1} (if $l = 1$) or in C_{f2} (if $l \geq 2$) in $\mathcal{O}(n \log k)$ expected rounds and $\mathcal{O}(kn)$ expected moves.

Phase 2 :

Phase 2 :

Reaches a configuration in C_0 in $\mathcal{O}(ln)$ expected rounds and $\iota(l(k + n))$ expected moves.

We can now apply the two previous algorithms to solve the **set formation problem**.

- Solve the orientation algorithm for $l = |SET| - 1$,

- Solve the orientation algorithm for $l = |SET| - 1$,
- Now that the ring is oriented, move the robots one by one

- Solve the orientation algorithm for $l = |SET| - 1$,
- Now that the ring is oriented, move the robots one by one

- Solve the orientation algorithm for $l = |SET| - 1$,
- Now that the ring is oriented, move the robots one by one

Complexity : $O((\log k + |SET|)n)$ rounds and $O(kn)$ moves.

Conclusion :

Conclusion :

- Our strong assumptions on the system are mandatory

Conclusion :

- Our strong assumptions on the system are mandatory
- Solving the gathering and orientation issues is very important and leads to tons of other problems solved

Conclusion :
